PLASTIC SURGERY | RECONSTRUCTIVE SURGERY | AESTHETIC SURGERY

## Dysport™

Dysport is a prescription injection for temporary improvement in the look of moderate to severe frown lines in adults less than 65 years of age. With a simple injection, Dysport stops the signal from the nerve to the muscles, ultimately resulting in a reduction of muscle activity and temporarily preventing contraction of the muscles that cause frown lines. The untreated facial muscles still contract normally, allowing you to freely show facial expressions, such as laughing, in untreated areas. With Dysport there is little to no downtime after injection.

### What to Expect From Dysport:

The procedure consists of several tiny injections in the desired area. No anesthesia is required. Discomfort is minimal and brief, and it is unlikely that you will develop significant side effects. Some people develop slight temporary bruising at the injection site that can easily be covered by makeup. You may resume normal activities immediately.

Within a few days you will see a marked improvement which may continue to improve for as long as a week and should last up to four months.
